

2.4 Accessing NACCS servers from NACCS users

2.4.1 Access Control with DNS for accessing NACCS servers

NACCS Center provides DNS server's IP address and domain names of each server computers of NACCS to NACCS users for domain name resolving. Accessing servers, NACCS users should translate NACCS servers' domain name to the IP address with DNS.

2.4.2 Switching from production environment to backup environment

Switching from production environment to backup environment of NACCS will be operated by NACCS Center with changing the setting information of DNS. Thus, NACCS users have no need to care about redirection of system environment in such case. NACCS users who follows the access control explained above, can switch from production environment to backup environment without significant actions.
