## 4.2 Interactive Processing Mode (SMTP Two-Way) 4.2.1 Outline of Interactive Processing Mode (SMTP Two-Way)

This processing mode is the processing mode to be used to send a message immediately after a message for user system is generated at NACCS Center server. Therefore, this processing mode provides faster response comparing to E-mail Style Processing Mode (Gateway). Since NACCS center server sends messages to user systems in real time, it is required that each user system has to be online all the time, and has to achieve high availability.

The Interactive Processing Mode (SMTP Two-Way) can be implemented only on environments where Gateway computer for SMTP Two-Way is installed on the user side and connected with a dedicated line or Fiber Optical Broadband networks.

Figure 4.2.1 shows outline of the Interactive Processing Mode (SMTP Two-Way) implemented in NACCS. In addition, for E-mail sending, refer to "4.6.1 E-mail".

Figure 4.2.1 Process outline of the Interactive Processing Mode (SMTP Two-Way)

- (1) A user creates and sends a NACCS EDI message that contains the necessary data segments for a transaction from the user's SMTP server to the NACCS's SMTP Two-Way Server over SMTP protocol.
- (2) The message transmitted to the NACCS's SMTP Two-Way Server is transferred to the Main Processing System. The message is processed and a Process Result Message is sent to the NACCS's SMTP Two-Way Server once again. The NACCS's SMTP Two-Way Server sends the Process Result Message to the user's SMTP server. Therefore, the user's SMTP server should always be activated.

# 4.2.2 Interface that users should follow

Users are required to comply with a certain interface in the Interactive Processing Mode. Through this interface, a user sends a Process Request Message originating from the user's E-mail address to NACCS Center server. And the user must receive all Process Result Messages (a Process Result Output Message or an Output Information Message) for the Process Request Message before sending the next Process Request Message.

More specifically, the user sends a Process Request Message with a unique Input Message ID to NACCS Center server. When the user receives all Process Result Messages corresponded to the Process Request Message (Process Result Output Message or Output Information Message) from NACCS Center server, the user checks that "the Input Message ID is the same value as specified in the corresponding request message", and send a subsequent transaction request message.

(For reference 1) Value forwarding from a Process Request Message to its Process Result Message (background information of the above procedure)

Table 4.2.1 shows patterns of generating Process Result Messages which are output to user system after a Process Request Message is sent from user system to NACCS Center server and is processed at NACCS Center server. In all the patterns, a value input in Input Message ID element in a request message is specified to a Process Result Output Message or an Output Information Message.

(See Table 3.5.2 "Correspondence of Input Message ID and Message Tag" for details on Input Message ID)

| Pattern | Process Re<br>Messag<br>Message T | esult<br>e<br>ype  | Occurrence of<br>Input Message ID<br>Value Forwarding | Remarks   |
|---------|-----------------------------------|--------------------|---|---|
| 1       | Process Result<br>Output Message  | [R]                | 0   | Input Message ID in the Process Result<br>Output [R] is verified for<br>correspondence check.   |
| 2       | Process Result<br>Output Message  | [R]                | 0   | *1 Because EXC type Output<br>Information Message [P] and [A] do not<br>forward Input Message ID (with  |
|         | Output<br>Information<br>Message  | [C] or<br>[P], [A] | [C]: ○<br>[P], [A]: △ (*1)                            | exceptions in some kinds of Output<br>Information Message), Input Message<br>ID in the Process Result Output [R] is<br>verified for correspondence check.                               |
| 3       | Output<br>Information<br>Message  | [R] or [M]         | 0   | Because Process Result Output<br>Messages are not generated in the<br>query process, Input Message ID in the<br>Output Information Message is verified<br>for the correspondence check. |

| Table 1 2 1 Value | forwarding from     | Dragana Dagi   | uaat Maaaaga ta ita | Drococo Docult Moccoco |
|-------------------|---------------------|----------------|---------------------|------------------------|
| Idule 4.2.1 Value | ioiwaiuiiu iioiii a | 1 FIUCESS REUL | uesi messaue io iis | FIUCESS RESULTIESSAUE  |
|                   |                     |                |                     |                        |

(For reference 2) Implication in "3.5.3 Sequential Processing (Index Tag)"

When executing a transaction for Sequential Processing, user system needs to implement an extra mechanism for Sequential Processing in addition to the interface in the Interactive Processing Mode, because in Sequential Processing a value specified in Message Tag in the Output Information Message sent from NACCS Center server needs to be carried over to the next transaction request at user system without any change.

See "3.5.3 Sequential Processing (Index Tag)" and "Table A6-8 (Output Information Code List)" for details.

# Figure 4.2.2 shows an image of the interface of the Interactive Processing Mode (SMTP Two-Way). message

\* Refer to Table 4.2.1 the patterns for "pattern 1" through "pattern 3" described in the figure \* Refer to "3.5 Message Control Fields" for information output in Input Message ID

Figure 4.2.2 Example Usage of the Interface of the Interactive Processing Mode (SMTP Two-Way)

## 4.2.3 Details of the Communications Protocol

In the NACCS Interactive Processing Mode (SMTP Two-Way), TCP/IP on the network and transport layers and SMTP on the upper layers are used as communications protocols.

### (1) SMTP specifications when sending a Process Request Message on SMTP

(A) Applicable SMTP commands

Table 4.2.2. shows the list of SMTP commands which can be used when sending a Process Request Message to NACCS Center server in the Interactive Processing Mode (SMTP Two-Way).

| Command    | Outline                 | Parameter         | Response from NACCS's<br>SMTP Two-Way Server<br>to user's SMTP server<br>(Normal response) |
|------------|-------------------------|-------------------|--|
| Request to | Request to open a       | Connection        | 220  |
| open a     | connection of TCP       | domain name, port |  |
| connection |                         | number            |  |
| HELO       | To declare use of the   | Sender host name  | 250  |
|            | communications          | (Domain name)     |  |
|            | channel and to identify |                   |  |
|            | the host                |                   |  |
| MAIL       | To start the E-mailing  | FROM: Sender      | 250  |
|            | transaction             | name              |  |
| RCPT       | To specify the receiver | TO: Receiver user | 250  |
|            | of the E-mail           | name              |  |
| DATA       | To start sending the E- | Message data      | 354  |
|            | mail body               |                   |  |
| RSET       | To stop forwarding the  | None              | 250  |
|            | E-mail                  |                   |  |
| QUIT       | To close the connection | None              | 221  |

 Table 4.2.2 SMTP Command List (When the Process Request Message is sent)

#### (B) Command sequence in Transmission of Process Request Message over SMTP

Figure 4.2.3 shows a sequence of SMTP commands issued during transmission of a Process Request Message from a user system to the NACCS's SMTP Two-Way Server. In addition, Table 4.2.3 shows description of each command.

Figure 4.2.3 SMTP Command Sequence on Transmission of a Process Request Message (Note) A user of the Interactive Processing Mode (SMTP Two-Way) needs to issue a QUIT command after completing transmission of the entire message text when sending Process Request Messages. If the user's SMTP server does not issue a QUIT command within one hour after the completion of a message transmission, the NACCS's SMTP Two-Way server declares a connection timeout and closes the current connection by force.

| Item<br>No. | Command                      | Description  |
|-------------|------------------------------|--|
| 1           | Request to open a connection | User's SMTP server requests to open a connection toward<br>port number 25 of NACCS's SMTP Two-Way Server.<br>NACCS's SMTP Two-Way Server sends back the response<br>code 220 as a normal response.<br>IP address for NACCS's SMTP Two-Way Server can be<br>obtained from NACCS Center's DNS.   |
| 2           | HELO Domain name             | User's SMTP server specifies domain name of user and<br>executes the command. If the server can be used, NACCS's<br>SMTP Two-Way Server will open a connection.<br>NACCS's SMTP Two-Way Server sends back the response<br>code 250 as a normal response.<br>NACCS Center notifies user's domain name in advance.   |
| 3           | MAIL FROM: E-mail<br>address | User's SMTP server specifies user's E-mail address and<br>executes the commands.<br>NACCS's SMTP Two-Way Server sends back the response<br>code 250 as a normal response.<br>NACCS Center notifies user's E-mail address in advance.   |
| 4           | RCPT TO: E-mail address      | User's SMTP server specifies NACCS Center server's E-mail<br>address and executes the command.<br>NACCS's SMTP Two-Way Server sends back the response<br>code 250 as a normal response.<br>NACCS Center notifies NACCS Center server's E-mail<br>address in advance.   |
| 5           | DATA                         | User's SMTP server executes starting command to send<br>Process Request Message.<br>NACCS's SMTP Two-Way Server sends back the response<br>code 354 as a normal response.<br>After that, user's SMTP server can send the message<br>(including communications protocol header).  |
| 6           | Send E-mail body             | User's SMTP server sends Process Request Message<br>following NACCS Procedure Specification. At the end edge of<br>a Process Request Message, only the line with .(dot) can be<br>sent.<br>After receiving the end edge, NACCS's SMTP Two-Way<br>Server sends back the response code 250 as a normal<br>response.<br>* When sending a Process Request Message, because the<br>mapping of the Process Result Message is needed, it is<br>necessary to refer to "4.2.2 Interface of the Interactive<br>Processing Mode that users should follow".<br>* It is necessary to make a line <crlf> after each 1,000<br/>bytes, but because in NACCS EDI specification, a new<br/>line <crlf> will be made within 1,000 bytes, it is not<br/>necessary for the user to be aware of it.<br/>* In SMTP, because the end edge of a message is<br/>recognized with <crlf>.<crlf>, if a message contains<br/>a line beginning with ".", the user system should add the<br/>dummy "." just before that. In NACCS's SMTP Two-Way</crlf></crlf></crlf></crlf> |

Table 4.2.3. Description about Command when Sending SMTP

| Item<br>No. | Command | Description   |
|-------------|---------|---|
|             |         | Server, the dummy "." will be deleted and delivered to the Main Processing System.  |
| 7           | RSET    | If user executes this command, it will return to the status<br>after HELO.<br>NACCS's SMTP Two-Way Server sends back the response<br>code 250 as a normal response.<br>(Normally, it is not necessary to execute this command). |
| 8           | QUIT    | User's SMTP server closes the SMTP connection.<br>NACCS's SMTP Two-Way Server sends back the response<br>code 221 as a normal response.   |

(Note 1) Response code of SMTP

There are optional characters behind 3 digits of each response code, but only refer to these first 3 digits.

Example: Response of HELO 250 XXXX.YYYY.ZZZZZ

Only refer to the response code and carry out the settlement methods described in the Table 4.2.4.

\* Reason: Because rear characters can be changed depending on Specification changes in NACCS Center server.

(Note 2) Timeout observation

Observe timeout of SMTP connection so that user's SMTP server can detect the failure of NACCS's SMTP Two-Way Server and network.

In this specification, more than one message can be sent in one connection, and as the timeout period of SMTP connection cannot be prescribed, the monitoring time must be decided based on operation methods applied by user.

(C) Settlement in abnormal cases

Settlement methods in case if an error occurs when sending SMTP are described in the Table 4.2.4.

| Item | Command     | Estimated errors and settlement methods  |
|------|-------------|--|
| 1    | Request to  | NACCS's SMTP Two-Way Server sends a request to open a connection   |
|      | open a      | however the request is not accepted  |
|      | connection  | Reasons and settlement methods:  |
|      | Connocation | The destination IP address is faulty.  |
|      |             | $\rightarrow$ Determine if it is connected to the IP address obtained from NACCS                         |
|      |             | Center's DNS or not.   |
|      |             | The destination port number is faulty.   |
|      |             | $\rightarrow$ Determine if a request is sent to open a connection to port number 25 or                   |
|      |             | not.   |
|      |             | NACCS Center server is under maintenance.  |
|      |             | → Information about maintenance of NACCS Center server is announced to                                   |
|      |             | the public on NACCS Information, so that should be checked. If the server is                             |
|      |             | under maintenance, re-send the request to open a connection after the                                    |
|      |             | maintenance work is finished.  |
|      |             | <ul> <li>NACCS Center server or network is damaged.</li> </ul>   |
|      |             | $\rightarrow$ Re-send another request to open a connection after a while. If it is not                   |
|      |             | recovered for a long time, send an investigation request to the Help desk of                             |
|      |             | NACUS Center.  |
|      |             | The information on failure is also updated on NACCS information.   |
|      |             | The information on the server's maintenance of failure used for connection test                          |
|      |             | even in the time when the connection test is done, confirm the situation with                            |
|      |             | NACCS Center   |
| 2    | HELO        | Errors in response (except for normal responses (250)) are returned.                                     |
| _    |             | Reasons and settlement methods:  |
|      |             | 1. For syntax error (500)  |
|      |             | $\rightarrow$ Confirm that the character string for sending the HELO command is                          |
|      |             | correct.   |
|      |             | 2. For command sequences error (503).  |
|      |             | ightarrow Execute the command with the right sequences described in the Figure                           |
|      |             | 4.2.3.   |
|      |             | Timeout due to no response from NACCS's SMTP Two-Way Server.   |
|      |             | Reasons and settlement methods:  |
|      |             | As failure may be occurring, cut off the connection for a while and re-send the                          |
|      |             | request for a connection.  |
| 3    | MAIL FROM   | Errors in response (except for normal responses (250)) are returned.                                     |
|      |             | Reasons and settlement methods:  |
|      |             | Confirm that the observator string for conding MAIL command is correct                                   |
|      |             | $\rightarrow$ Command sequences error (503)  |
|      |             | $\rightarrow$ Execute the command with the right sequences described in the Figure                       |
|      |             | 423  |
|      |             |  |
|      |             | Timoout due te ne recenence from NACCS's SMTD Two Wey Server   |
|      |             | Passans and sottlement methods:  |
| 1    |             |  |
|      |             | As failure may be occurring, out off the connection for a while and ro cond the                          |
|      |             | As failure may be occurring, cut off the connection for a while and re-send the request for a connection |

Table 4.2.4 Settlement methods for sequential errors of SMTP

| Item | Command                            | Estimated errors and settlement methods   |
|------|------------------------------------|---|
| 4    | RCPT TO                            | <ul> <li>Errors in response (except for normal responses (250)) are returned.</li> <li>Reasons and settlement methods:</li> <li>1. For syntax error (500) or parameter error (501) or domain name error (553).</li> <li>→ Confirm if the character string of sending RCPT command is right or not.</li> <li>2. For command sequences error (503).</li> <li>→ Execute the command with the right sequences described in the Figure 4.2.3.</li> <li>Timeout due to no response from NACCS's SMTP Two-Way Server.</li> <li>Reasons and settlement methods:</li> <li>As failure may be occurring, cut off the connection for a while and re-send the request for a connection.</li> </ul> |
| 5    | DATA                               | <ul> <li>Errors in response (except for normal responses (354)) are returned.</li> <li>Reasons and settlement methods: <ol> <li>For syntax error (500)</li> <li>Confirm that character string of sending DATA command is correct.</li> </ol> </li> <li>For command sequences error (503). <ol> <li>Execute the command with the right sequences described in the Figure 4.2.3.</li> </ol> </li> <li>Timeout due to no response from NACCS's SMTP Two-Way Server.</li> <li>Reasons and settlement methods: <ol> <li>As failure may be occurring, cut off the connection for a while and re-send the request for a connection.</li> </ol> </li> </ul>                                   |
| 6    | Send Process<br>Request<br>Message | Errors occur during communication.<br>Reasons and settlement methods:<br>As NACCS's SMTP Two-Way Server can be damaged, re-send the request<br>after a short interval. If it is not recovered for a long time, send an investigation<br>request to the Help desk of NACCS Center.   |
| 7    | RSET                               | Errors in response (except for normal responses (250)) are returned.<br>Reasons and settlement methods:<br>For syntax error (500)<br>→ Confirm that character string of sending RSET command is correct.<br>Timeout due to no response from NACCS's SMTP Two-Way Server.<br>Reasons and settlement methods:<br>As failure may be occurring, cut off the connection for a while and re-send the<br>request for a connection.   |

| 9    | Others                             | Detect abnormalities during communication.<br>Reasons and settlement methods:<br>As failure may be occurring, re-send the request to open a connection.   |

#### (2) SMTP specifications when receiving a Process Result Message on SMTP

### (A) Applicable SMTP commands

Table 4.2.5 shows SMTP commands used by the NACCS's SMTP Two-Way Server and responses sent by the user's SMTP server in the Interactive Processing Mode (SMTP Two-Way).

| Command    | Outline                    | Parameter         | Response from user's SMTP     |
|------------|----------------------------|-------------------|-------------------------------|
| Command    | Oddinie                    | rarameter         | actives to NACCS's SMTD Two   |
|            |                            |                   | Server to NACCS'S SIVITE TWO- |
|            |                            |                   | Way Server (Normal response)  |
| Request to | Request to open a          | Connection        | 220                           |
| open a     | connection of TCP          | domain name, port |                               |
| connection |                            | number            |                               |
| HELO       | To declare use of the      | Sender host name  | 250                           |
|            | communications channel     | (Domain name)     |                               |
|            | and to identify the host   |                   |                               |
| MAIL       | To start the E-mailing     | FROM: Sender      | 250                           |
|            | transaction                | name              |                               |
| RCPT       | To specify the receiver of | TO: Receiver user | 250                           |
|            | the E-mail                 | name              |                               |
| DATA       | To start sending the E-    | Message data      | 354                           |
|            | mail body                  |                   |                               |
| RSET       | To stop forwarding the E-  | None              | 250                           |
|            | mail                       |                   |                               |
| QUIT       | To close the connection    | None              | 221                           |

#### Table 4.2.5 SMTP Command List (When the Process Result Message is received)

#### (B) SMTP command sequence in receipt of a Process Result Message

Figure 4.2.4 shows a sequence of SMTP commands issued during transmission of a Process Result Message from the NACCS's SMTP Two-Way Server to a user system. Table 4.2.6 shows description of each command.

Figure 4.2.4 SMTP Command Sequence on Transmission of a Process Result Message

When receiving a Process Result Message, the NACCS's SMTP Two-Way Server always issues a QUIT command to close the current connection after completing the transmission of a message to a user system. Only one message is transmitted during one connection.

|             |                                | in about Command when recomming own  |
|-------------|--------------------------------|--|
| Item<br>No. | Command                        | Description  |
| 1           | Request to open a connection   | NACCS's SMTP Two-Way Server sends request to<br>open a connection toward port number 25 of user's<br>SMTP server.<br>User's SMTP server sends back the response code<br>220 as a normal response   |
| 2           | HELO Domain name               | NACCS's SMTP Two-Way Server specifies NACCS<br>Center's domain and executes the command. If the  |
|             |                                | server can be used, the user's SMTP server will open a connection and send back the response code 250 as a normal response.  |
| 3           | MAIL FROM: E-mail address      | NACCS's SMTP Two-Way Server specifies center's E-<br>mail address and executes the command.<br>User's SMTP server sends back the response code<br>250 as a normal response.  |
| 4           | RCPT TO: E-mail address        | NACCS's SMTP Two-Way Server specifies users' E-<br>mail addresses and executes their commands.<br>User's SMTP server sends back the response code<br>250 as a normal response.   |
| 5           | DATA                           | NACCS's SMTP Two-Way Server executes a starting<br>command to send Process Result Messages.<br>User's SMTP server sends back the response code<br>354 as a normal response.<br>After that, NACCS's SMTP Two-Way Server sends the<br>message (including communications protocol header).  |
| 6           | Send Process Result<br>Message | <ul> <li>NACCS's SMTP Two-Way Server sends Process<br/>Result Messages following NACCS Procedure<br/>Specification.</li> <li>After receiving the end edge, User's SMTP server<br/>sends back the response code 250 as a normal<br/>response.</li> <li>* In SMTP, as the end edge of a message is<br/>recognized with <crlf>.<crlf>, if there is a line<br/>with only ".", NACCS's SMTP Two-Way Server will<br/>add a dummy "." in front of it. In User's SMTP server,<br/>the dummy "." will be deleted and the message<br/>delivered to user procedure processing.</crlf></crlf></li> </ul> |
| 7           | RSET                           | If the NACCS's SMTP Two-Way Server executes this<br>command, it will return to the status after HELO. User's<br>SMTP server sends back the response code 250 as a<br>normal response.<br>(Normally, it is not necessary to execute this command)   |
| 8           | QUIT                           | NACCS's SMTP Two-Way Server closes the SMTP connection.<br>User's SMTP server sends back the response code 221 as a normal response.   |

Table 4.2.6. Description about Command when Receiving SMTP

(Note) Timeout observation

Observe timeout from sending request to open a connection until QUIT command is finished so that NACCS's SMTP Two-Way Server can detect the failures of user's SMTP server and network. If the QUIT command is not finished in 3 minutes after request to open a connection has been sent, NACCS's SMTP Two-Way Server will recognize it as a timeout.

(C) Settlement in abnormal cases

If NACCS's SMTP Two-Way Server recognizes interferences such as unavailability of request to open a connection, errors of SMTP sequence or timeout, messages except for transaction output for report will not be guaranteed.

If a transaction output for the report cannot be sent normally, NACCS's SMTP Two-Way Server will store that transaction output in the Error message queue of the Output Message Cache in NACCS Center. The messages stored in the Error message queue can be retrieved if the user carries out the Error message retrieving procedure (SYG).

(Note) The Error message retrieving procedure (SYG), and guaranteed message type, etc. is mentioned in "3.7 Output Message Cache and retrieving procedure".

# 4.2.4 Message format

In the Interactive Processing Mode (SMTP Two-Way), a communications protocol header and a trailer are added to a NACCS EDI message, an attachment file message or a XML format message.

The message formats are outlined as follows:

### (1) NACCS EDI message

Figure 4.2.5 shows outline of NACCS EDI message format (Interactive Processing Mode (SMTP Two-Way)).

NACCS EDI message

(Refer to "4.2.4 (5) Contents of Subject field of the SMTP header")

Figure 4.2.5 Outline of NACCS EDI message Format (Interactive Processing Mode (SMTP Two-Way))

Figure 4.2.6 shows a layout of a NACCS EDI message sent to NACCS Center server from a user in the Interactive Processing Mode (SMTP Two-Way).

- (A) A NACCS EDI message body comes after the "<CRLF>" code placed after the SMTP header.
- (B) "." (Period) and "<CRLF>" are placed after the NACCS EDI message body, as communications protocol trailer.

| Communications Protocol Header<br>(SMTP) |                            |    |                       |    |    |  |    |    |  |    |   |
|--|----------------------------|----|-----------------------|----|----|--|----|----|--|----|---|
| From:<br>XXXXX<br>XXXX<br>XX             | To:<br>XXXXX<br>XXX<br>XXX | LF | Mime-<br>Version: 1.0 | CR | LF | Content-<br>Type:<br>Text/plain;<br>charset<br>="EUC-JP" | CR | LF | Content-<br>Transfer-<br>Encoding:<br>8bit | CR | Ч |

Figure 4.2.6 Message Layout

(For reference) The following figure shows segments of a message displayed on text editor tools, etc.

| From: XXXXXXXXXXX <crlf><br/>To: XXXXXXXXXXX<crlf><br/>Mime-Version: 1.0<crlf></crlf></crlf></crlf> | Communications protocol header<br>(SMTP header) |                |
|---|---|----------------|
| Content-Type: Text/plain; charset="EUC-JP" <crlf></crlf>  |   |                |
| Content-Transfer-Encoding: 8bit< CRLF>  |   |                |
| <crlf><br/>XXXXXXXXXXXXXXX<crlf><br/>XXXXXXX<crlf><br/>XXXXXXX<crlf></crlf></crlf></crlf></crlf>    | Procedure-by-procedure field                    | CS EDI<br>sage |
| XXXXXXX <crlf><br/>.<crlf></crlf></crlf>  | Communications protocol trailer                 |                |
|   | (SMTP trailer)                                  |                |

(Note) Appearance of <CRLF> may be different depending on text editors, etc.

() Communications protocol trailer

In SMTP, ". <CRLF>" (a period line) is added to the end of the message. Terminat ion of the message is recognized by the sequence of "<CRLF>. <CRLF>", which is the combination of "<CRLF>", placed at the last message body and this additional period line.

() How to distinguish between communications protocol trailer and "." (dot)

"." is communications protocol trailer which describes the end edge of the response. In SMTP, the end edge of a message is recognized with <CRLF>.<CRLF>. If there is a message in which "." is placed in front of the line, in order to distinguish with the communications protocol trailer, NACCS Center will add "." (Byte stuff) in front of the line and send it back to user. In case if the arrival response message has a "." in front of the line and the next character string is not <CRLF>, user will delete "." (Byte stuffing) in front of the line. Failure to delete byte stuff causes errors such as messages containing an additional unwanted "." (dot) and messages with an extra byte at the user system.

## (2) Attachment file message

Figure 4.2.7 shows outline of attachment file message (Interactive Processing Mode (SMTP Two-Way)).

Refer to "4.6.2 Attachment file" for attachment files available for NACCS.

(Refer to "4.2.4 (4) Contents of the SMTP header (B) NACCS EDI message")

Figure 4.2.7 Outline of attachment file message Format (Interactive Processing Mode (SMTP Two-Way))

Figure 4.2.8 shows a layout of an attachment file message sent to NACCS Center server from a user in the Interactive Processing Mode (SMTP Two-Way).

#### (A) Filing method

In NACCS, BASE64 of MIME (Multipurpose Internet Mail Extensions) is used when sending and receiving the message. Attachment file message is stored in the attached file format. Details of regulations when sending the attachment file message is as follows.

- MIME version is 1.0.
- The Content-type of the SMTP header is multipart/mixed, the Content-type of the NACCS message is Text/plain, the Content-type of the attached file is specified according to each attached file.
- The Content-Transfer-Encoding of the attached file is appointed as BASE64.
- NACCS EDI message can't be abbreviated. In addition, the attached file needs to be placed behind the NACCS EDI message.
- In Content-Disposition, specify the "attachment" and specify the file's name in "filename".
- (B) Image of message
  - The attachment file message is structured with a communications protocol header, and a message and communications protocol trailer.
  - NACCS EDI message, attached file's body encoded with BASE64 comes after the <CRLF> code placed after SMTP header.
  - <CRLF>, "."(period), and <CRLF> are placed after the attachment file message as the communications protocol trailer.

| Communications Protocol Header<br>(SMTP Header) |    |    |                     |    |    |                          |    |    |  |    |    |    |   |  |
|---|----|----|---------------------|----|----|--------------------------|----|----|--|----|----|----|---|--|
| From:<br>XXXX<br>XXX<br>X                       | CR | LF | To:<br>XXXXX<br>XXX | CR | LF | Mime-<br>Version:<br>1.0 | CR | LF | Content-<br>Type:<br>multipart/<br>mixed;<br>boundary=<br>"YYYYYY" | CR | LF | CR | Ц |  |

|---|-------------------------|----|----|------------|------------|------------|------------|------------|----|----------|------------------------------|------------|-----|
| L | Attachment file<br>Body | CR | LF | - (hyphen) | - (hyphen) | YYY<br>YYY | - (hyphen) | - (hyphen) | CR | LF       |                              | CR         | Ŀ   |

Γ

(Note) Setting point of this item is based on E-mail software. "8 bit" is just an example. Figure 4.2.8 Example of attachment file message Structure (For reference) Text presentation of the above contents on text editor tools, etc. is described as follow.

From: XXXXX...XXX<CRLF> Communications protocol To: XXXXX...XXX<CRLF> header (SMTP header) Mime-Version: 1.0<CRLF> Content-Type: Multipart/mixed; boundary="YYYYY"<CRL <CRLF> --YYYYYY<CRLF> Content-Type: Text/plain; charset="EUC-JP"<CRLF> Content-Transfer-Encoding: 8bit< CRLF> <CRLF> message <CRLF> --YYYYYY<CRLF> Content-Type: "Basing on attached file"; name="file name"<CRLF> Content-Transfer-Encoding: BASE64<CRLF> Content-Disposition: attachment; filename="file name"<CRLF> Repeatable <CRLF> <CRLF> -- YYYYYY--<CRLF> Communications protocol .<CRLF> trailer (SMTP trailer)

Figure 4.2.9 shows outline of XML format message format (Interactive Processing Mode (SMTP Two-Way)).

Figure 4.2.9 XML format message (Interactive Processing Mode (SMTP Two-Way))

Lay out of an XML format message sent to NACCS Center server from a user in the Interactive Processing Mode is described as follow.

- (A) A XML format message body comes after the "<CRLF>" code placed after the SMTP header.
- (B) <CRLF>, "." (period) and <CRLF> are placed after the XML format message as communications protocol trailer.
- (C) Make a new line after each 1,000 bytes. If not, an error will occur.
- (D) <CRLF> exists in each line of XML message.
- (E) Character code of XML message is EUC-JP, EUC-JP must be recorded in encoding field of XML header.

For details of XML format message structure which user sends to NACCS Center sever in Interactive Processing Mode (SMTP Two-Way), refer to XML Subjected Procedure of "Table A6-8 (Output Information Code List)".

(For reference) Text presentation of the above contents on text editor tools, etc. is described as follow.

| From: XXXXXXXX <crlf><br/>To: XXXXXXXX<crlf><br/>Mime-Version: 1.0<crlf><br/>Content-Type: Text/plain; charset="EUC-JP"<crlf></crlf></crlf></crlf></crlf> | Communications<br>≻ protocol header<br>(SMTP header) |

## (4) Contents of the SMTP header

### (A) NACCS EDI message

Contents of the SMTP header included in Process Request Message or Process Result Messages are as follows.

#### 1) Process Request Message

Table 4.2.7 shows the contents of the SMTP header in a Process Request Message sent from a user.

| Table 4.2.7 | SMTP header ( | Process Rec | uest Message) |
|-------------|---------------|-------------|---------------|
|             |               |             | 1             |

| Item<br>No. | Item   | Contents specified by the user   |  |  |
|-------------|--|--|--|--|
| 1           | The sender of the E-mail         In NACCS, a source (user) E-mail address assigned by NACCS (is specified         From       is specified         If no address is specified, an error occurs. (See "4.2.4 (6) E-mail         address used in the Interactive Processing Mode (SMTR Two Was) |  |  |  |
| 2           | То   | The receiver of the E-mail<br>In NACCS Center server's E-mail address allocated for the Interactive<br>Processing Mode (SMTP Two-Way) is specified. (See "4.2.4 (6) E-mail<br>address used in the Interactive Processing Mode (SMTP Two-Way)") |  |  |
| 3           | Mime-Version   | In NACCS, "1.0" is specified   |  |  |
| 4           | Content-Type   | Text/plain; charset="EUC-JP" is specified  |  |  |
| 5           | Content-Transfer-<br>Encoding  | In NACCS characters are treated as EUC characters. "8bit" is specified   |  |  |

#### 2) Process Result Message

Table 4.2.8 shows contents of the SMTP header in a Process Result Message (Process Result Output Message and Output Information Message) sent from NACCS to a user.

|             | Table 4.2.8 SMTP header (Process Result Message) |   |  |  |
|-------------|--|---|--|--|
| Item<br>No. | Item   | Contents specified by the SMTP Two-Way NACCS Center server  |  |  |
| 1           | From   | The sender of the E-mail<br>In NACCS, NACCS Center server's E-mail address allocated for the<br>Interactive Processing Mode (SMTP Two-Way) is specified<br>(See "4.2.4 (6) E-mail address used in the Interactive Processing Mode<br>(SMTP Two-Way)") |  |  |
| 2           | То   | The receiver of the E-mail<br>In NACCS user's E-mail address used to store Process Result<br>Messages is specified<br>(See "4.2.4 (6) E-mail address used in the Interactive Processing Mode<br>(SMTP Two-Way)")                                      |  |  |
| 3           | Date   | The date the message is retrieved by the user is specified  |  |  |
| 4           | Subject  | (See "4.2.4 (5) Contents of Subject field of the SMTP header")  |  |  |
| 5           | Mime-Version                                     | In NACCS, "1.0" is specified  |  |  |
| 6           | Content-Type                                     | Text/plain; charset="EUC-JP" is specified   |  |  |
| 7           | Content-Transfer-<br>Encoding                    | In NACCS characters are treated as EUC characters. "8bit" is specified  |  |  |

### (B) Attachment file message

Contents of the SMTP header included in Process Request Message and Process Result Message are as follows.

1) Process Request Message

Table 4.2.9 shows contents of the SMTP header in a Process Request Message sent from a user.

| Item | Item         | Contents specified by the user   |
|------|--------------|--|
| No.  |              |  |
|      |              | The sender of the E-mail   |
|      |              | In NACCS, a source (user) E-mail address assigned by NACCS center      |
| 1    | From         | is specified. If no address is specified, error will occur             |
|      |              | (See "4.2.4 (6) E-mail address used in the Interactive Processing Mode |
|      |              | (SMTP Two-Way)")   |
|      |              | The receiver of the E-mail   |
|      |              | In NACCS, NACCS Center server's E-mail address allocated for the       |
| 2    | То           | Interactive Processing Mode (SMTP Two-Way) is specified.               |
|      |              | (See "4.2.4 (6) E-mail address used in the Interactive Processing Mode |
|      |              | (SMTP Two-Way)")   |
| 3    | Mime-Version | In NACCS, "1.0" is specified.  |
| 5    |              | If it is not specified, that E-mail will be omitted.                   |
|      | Content-Type | For SMTP header, multipart/mixed; boundary="optional value" is         |
|      |              | specified.   |
| 1    |              | In addition, NACCS message section is specified by Text/plain;         |
| 4    |              | charset="EUC-JP" and attachment file by basing on attached file.       |
|      |              |  |
|      |              | If it is not specified, that E-mail will be omitted.                   |
|      | Content-     | It is not specified in SMTP header.                                    |
| 5    | Transfer-    | "8bit" is specified in NACCS message and BASE64 is specified in        |
|      | Encoding     | attached file.   |
| 6    | Content-     | It is not specified in SMTP header and NACCS message.                  |
| 6    | Disposition  | Attachment is specified in attached file and "file name" in filename.  |

| Table 4.2.9 | SMTP Header | (Process Request | Message) |
|-------------|-------------|------------------|----------|

2) Process Result Message

Table 4.2.10 shows contents of the SMTP header in a Process Result Message sent from NACCS to a user.

|             | Tab                               | le 4.2.10 SMTP Header (Process Result Message)  |
|-------------|-----------------------------------|---|
| ltem<br>No. | Item                              | Contents specified by the user  |
| 1           | From                              | The sender of the E-mail.<br>In NACCS, NACCS Center server's E-mail address allocated for the<br>Interactive Processing Mode (SMTP Two-Way) is specified.<br>(See "4.2.4 (6) E-mail address used in the Interactive Processing Mode<br>(SMTP Two-Way)") |
| 2           | То                                | The receiver of the E-mail.<br>In NACCS, user's E-mail address used to store Process Result<br>Messages is specified.<br>(See "4.2.4 (6) E-mail address used in the Interactive Processing Mode<br>(SMTP Two-Way )")                                    |
| 3           | Date                              | The date the message is retrieved by the user is specified.   |
| 4           | Subject                           | (See "4.2.4 (5) Contents of Subject field of the SMTP header")  |
| 5           | Mime-Version                      | In NACCS, "1.0" is specified.   |
| 6           | Content-Type                      | For SMTP header, multipart/mixed; boundary="optional value" is<br>specified.<br>In addition, NACCS message section is specified by Text/plain;<br>charset="EUC-JP"and attachment file by basing on attached file.                                       |
| 7           | Content-<br>Transfer-<br>Encoding | It is not specified in SMTP header.<br>"8bit" is specified in NACCS message and BASE64 is specified in<br>attached file.  |
| 8           | Content-<br>Disposition           | It is not specified in SMTP header and NACCS message.<br>Attachment is specified in attached file and "file name" in filename.  |

#### (C) XML format message

Contents of the SMTP header included in Process Request Message and Process Result Message are as follows.

#### 1) Process Request Message

Table 4.2.11 shows contents of the SMTP header in a Process Request Message sent from a user.

| Item | Item         | Contents specified by the user   |
|------|--------------|--|
| INO. |              |  |
| 1    | From         | The sender of the E-mail.  |
|      |              | In NACCS, a source (user) E-mail address assigned by NACCS center      |
|      |              | is specified. If no address is specified, error will occur.            |
|      |              | (See "4.2.4 (6) E-mail address used in the Interactive Processing Mode |
|      |              | (SMTP Two-Way)")   |
| 2    | То           | The receiver of the E-mail.  |
|      |              | In NACCS, NACCS Center server's E-mail address allocated for the       |
|      |              | Interactive Processing Mode (SMTP Two-Way) is specified.               |
|      |              | (See "4.2.4 (6) E-mail address used in the Interactive Processing Mode |
|      |              | (SMTP Two-Way)")   |
| 3    | Mime-Version | In NACCS, "1.0" is specified.  |
|      |              | If it is not specified, that E-mail will be omitted.                   |
| 4    | Content-Type | In NACCS, due to using message in EUC, Text/plain;charset="EUC-JP"     |
|      |              | is specified   |
| 5    | Content-     | In NACCS characters are treated as EUC characters. "8bit" is           |
|      | Transfer-    | specified.   |
|      | Encoding     |  |

| Table 4.2.11 | SMTP Header ( | (Process Request | Message) |
|--------------|---------------|------------------|----------|
|              |               | \                | U /      |

#### 2) Process Result Message

For details about contents of the SMTP header in a Process Result Message sent from NACCS to a user, refer to "4.2.4 (4) Content of the SMTP header (A) NACCS EDI message – Table 4.2.8" above.

#### (5) Contents of the Subject field of the SMTP header

The contents of the Subject field of the SMTP header included in a Process Result Message sent from NACCS Center server to a user are as follows.

(A) Contents of Subject field

A common format is used for both Process Result Output Messages and Output Information Messages.

Table 4.2.12 shows contents of Subject field.

| Field name     | length | Outline  |  |
|----------------|--------|--|--|
| Procedure-by-  |        | For example, Process Result Code, declaration number,  |  |
| procedure data | 64     | B/L Number and control number are specified.           |  |
|                |        | A space is used as a data separator.                   |  |
|                |        | (Refer to "Table A6-8 (Output Information Code List)") |  |

| Table 4.2.12 | Contents | of Subi | ect Field |
|--------------|----------|---------|-----------|
| 10010 1.2.12 | Contonto |         | 0001 1010 |

#### (B) Remark

Since contents of Subject field are included in a NACCS EDI message body, Subject field is not specifically useful for users who do not need to handle its contents. (Subject field can be omitted)

## (6) E-mail address used in the Interactive Processing Mode (SMTP Two-Way)

(A) Outline of E-mail address and address allocation guideline

Figure 4.2.10 shows an example E-mail addresses specified in the SMTP headers enclosed in Process Request Message and Process Result Messages. User's E-mail address is specified in From field of "1) Process Request Message" and To field of "2) Process Result Message". NACCS Center server's E-mail address is specified in the To field of "1) Process Request Message" and the From field of "2) Process Result Message."

(B) User E-mail address format

Figure 4.2.11 shows the format of user E-mail addresses used in the Interactive Processing Mode (SMTP Two-Way).

Figure 4.2.11 User E-mail Address Format in the Interactive Processing Mode (SMTP Two-Way) (in Single-Byte Capital Letters)

Since NACCS Center allocates an E-mail address to each user for the Interactive Processing Mode (SMTP Two-Way), users are not allowed to choose their own E-mail address.

#### (C) NACCS Center server E-mail address format

Figure 4.2.12 shows the format of NACCS Center server E-mail address used in the Interactive Processing Mode (SMTP Two-Way).

Figure 4.2.12 NACCS Center Server E-mail Address Format in the Interactive Processing Mode (SMTP Two-Way) (in Single-Byte Capital Letters)

Moreover, the Main center and the Backup center can be switched by changing inside Backbone Network for NACCS User Network in NACCS Center. As a result, the user does not need to recognize the NACCS server's E-mail address when the Backup center is operated.

(D) E-mail address used in a message sent from a user

E-mail addresses in the From and To fields of the SMTP header in a Process Request Message sent from a user to the NACCS's SMTP Two-Way Server are specified as follows.

- From: user E-mail address
- To: NACCS Center server E-mail address

Entry of an E-mail address in From and To fields is mandatory because the E-mail address in the From field is used to authenticate the user at the NACCS's SMTP Two-Way Server and the E-mail address in the To field is used to specify the user's SMTP Server as the message destination.

If the NACCS's SMTP Two-Way Server cannot authenticate the E-mail address specified in the From field, the message is discarded.

(E) E-mail address used in a message sent to a user

E-mail addresses in From and To fields of the SMTP header in a Process Result Message sent from the NACCS's SMTP Two-Way Server to a user are specified as follows.

From: NACCS Center server E-mail address To: user E-mail address

These addresses are specified at the NACCS's SMTP Two-Way Server.

(F) Notification of E-mail address

The E-mail address used in a message sent to / from a user is provided and announced by NACCS Center. Users must use these addresses.

# 4.2.5 Procedure sequential processing

Figure 4.2.16 shows procedure sequential processing in Interactive Processing Mode (SMTP Two-Way). For message classifications, refer to "3. Message Format and Structure ".

Figure 4.2.13 Example of Processing in Interactive Processing Mode (SMTP Two-Way)

- (1) User's SMTP server sends Process Request Message in SMTP to NACCS's SMTP Two-Way Server.
  - For SMTP sending sequence, refer to "4.2.3 Details of communications protocol".
  - As Process Request Message format is different for each procedure, refer to Procedure Specifications.
  - Process Request Message formats are represented by NACCS EDI format, MIME format and XML format.
- (2) NACCS's SMTP Two-Way Server checks the message and sends the Process Request Message to the Main Processing System.
- (3) The Main Processing System checks the message and executes the procedure.
- (4) and (5) The Main Processing System sends Process Result Message to NACCS's SMTP Two-Way Server.
   (According to the Procedure Specification, there are cases in which more than one Process Result Message will occur. Figure 4.2.13 shows the case in which Process Result Output Messages of Message Type [R] and Output Information Message (for screen) of Message Type [C] are sent).

- (6) and (7) The NACCS's SMTP Two-Way Server sends the Process Result Message in SMTP to the user's SMTP server.
  - For the SMTP receiving sequence, refer to "4.2.3 Details of communications protocol".
  - Because the Process Result Message (for screen) formats are different for each procedure, refer to the Procedure Specifications.
  - Process Result Message formats (for screen) are NACCS EDI format and XML format.
  - 1 E-mail address of user can only send the next message after the Process Result Messages (message type is either R or C) described in 6) and 7) return to Process Request Messages described in 1). Therefore, in the user's SMTP server, confirmation must be carried out to check if the Process Result Messages (message type is R or C) described in 6) and 7) has returned to Process Request Messages described in 1). In addition, because 1 E-mail address cannot send more than one message at the same time, more than one message can only be sent if there is more than one E-mail address for the user.

\* According to the Procedure Specifications, there are cases in which it is not Message Type [R] or [C] but Message Type [M] will return. In these cases, it is necessary to carry out the confirmation procedure to check if Message Type [M] has returned or not.

(8) and (9) The Main Processing System sends the Output Information Message (for report) to the NACCS's SMTP Two-Way Server.

(No Output Information Message (for report) may be generated or multiple Output Information Messages (for report) may be generated depending on the procedure. Figure 4.2.13 shows a case in which 2 report messages are sent).

- (10) and (11) The NACCS's SMTP Two-Way Server sends the Output Information Message (for report) to the user's SMTP server.
  - For the SMTP receiving sequence, refer to "4.2.3 Details of communications protocol".
  - Because Output Information Message (for report) formats are different according to each Procedure Specification, refer to Procedure Specification.
  - Output Information Message (for report) formats are NACCS EDI format and XML format.
- (Note 1) Process Result Messages have the same patterns as described in "Figure 4.2.2 Example Usage of the Interface of the Interactive Processing Mode (SMTP Two-Way)". It is only necessary to check up with the Process Request Message if the message type is [R] or [M].
- (Note 2) Arrival order toward user's SMTP server of 6), 7),10),and 11) is not guaranteed.
- (Note 3) EXC message, EXZ message makes the opportunities for the third party to carry out the procedure, but just the sequence of 8),10) or 9),11) in Figure 4.2.13.

# 4.2.6 Others

## (1) Retention period of messages stored in the Output Message Cache

Users must promptly retrieve the Process Result Messages in the Output Message Cache. After that, the messages in the Output Message Cache will be deleted.

However, the Process Result Messages which are not retrieved by users will be retained in the Output Message Cache for 7 days since the registration day (including Saturday, Sunday and National holiday). Message deletion will be carried out at a specified time during the night. In "Golden Week" (holiday week from the end of April to early May) or New year's holiday, NACCS Center will change the setting for a special retention period.

(For reference) An Example of Deleting the Process Result Messages Stored in the Output Message Cache (In case if the definite time is temporarily set at 0:30)

#### (2) Retention period for attachment files stored in attachment file storage table

For retention period for attachment files for each procedure, refer to "System Retention Period for Each (DB)" in "Procedure Specifications".

#### (3) Restrictions

Interactive Processing Mode (SMTP Two-Way) users have to obey the following restrictions.

- (A) Interactive Processing Mode (SMTP Two-Way) installs user's SMTP sever in user system, and can only use if the access line is dedicated line connection or Fiber Optic Broadband connection.
- (B) In principle, user's SMTP server must be activated and be in a condition where messages can be received at all times.
- (C) If hardware failure occur in NACCS Center server and no response returns, users have to wait at least 5 minutes and try to connect with NACCS's SMTP Two-Way Server again, later.
- (D) If errors occur in NACCS Center server and a Process Result Output Message returns notifying "Center busy" users have to wait at least 3 minutes and try to connect with NACCS's SMTP Two-Way Server again, later.
- (E) Users have to carry out stored message retrieving procedure (REQ), error message retrieving procedure (SYG) periodically (some times a day, if that does not cause the difficulties to the procedures), and to retrieve the messages stored in the Output Message Cache in NACCS Center server. However, carrying out these procedures frequently may overload NACCS Center sever, so it is safer to take an interval of about 30 minutes before executing the next procedure.

(F) If the Process Result Messages for Process Request Messages sent by users are not returned in 2 minutes, it is considered that the process has timed out and users must send these messages again.

#### (4) Other Precautions

Interactive Processing Mode (SMTP Two-Way) users have to pay attention to the notices below.

- (A) Messages via the Output Message Cache in NACCS Center server may return to users 2 times due to the timing of failure occur. Because input information is set in the Input Message ID without any changes, it is possible that the second message can be ignored by configuring user system. (except for EXC messages)
- (B) If more than one Process Result Message occurs in 1 transaction, the arrival order of these messages cannot be guaranteed in user system (Refer to Figure 4.2.14). Therefore, user system must not be so built that Process Result Output Messages are processed first.
- (C) If NACCS's SMTP Two-Way Server cannot complete the connection with user's SMTP server in 3 minutes, NACCS's SMTP Two-Way Server seem to be timeout, the connection will be cut compulsively and the messages will be omitted. However, if these messages are report messages outputs, they will be stored in the Error message queue of the Output Message Cache in the Center. The messages stored in Error message queue can be retrieved if users carry out Error message retrieving procedure (SYG).
- (D) When sending the Process Request Messages, the messages in which the user's E-mail address in "From" line of SMTP header is not completely consistent will be omitted in NACCS's SMTP Two-Way Server. User system must specify the right E-mail address and send the messages again.
- (E) Because the NACCS's SMTP Two-Way Server sends the receiving completion notification back to the Main Processing System, users should not send it.
- (F) In case of an overload in the system, operation limit such as halts of receiving Process Request Message from all users may be used. In this case, NACCS Center will inform the users.
- (G) If NACCS is operated in the Backup center due to a large-scale failure or a large-scale disaster, connect to SMTP Two-Way server of the Backup center.
- (H) An environment to test the connection is built in a corner of the Backup center. Therefore, if the Main center is affected by a large-scale failure or a large-scale disaster, the system will operate in the Backup center, and the connection test may be unavailable.

Figure 4.2.14 Arrival Order of More than One Process Result Messages (Example)

## (5) Value of each timer classification

Table 4.2.13 shows value of each timer prescribed in Interactive Processing Mode (SMTP Two-Way). Besides, specified place for each timer is described from Figure 4.2.15 to Figure 4.2.18.

| ID  | Observation content                                       | Timer's value        |
|-----|---|----------------------|
| T01 | Observation time for the SMTP connection between user     | Specified by user    |
|     | system and NACCS's SMTP Two-Way Server when user          |                      |
|     | sends the message   |                      |
| T02 | Time without communication after NACCS's SMTP Two-        | Specified by user    |
|     | Way Server opens a connection with user system            |                      |
| T03 | Time without communication after user system opens a      | 1 hour               |
|     | connection with NACCS's SMTP Two-Way Server               |                      |
| T04 | Observation time for the SMTP connection between          | 3 minutes            |
|     | NACCS's SMTP Two-Way Server and user system when          |                      |
|     | NSCCS Center sends the message                            |                      |
| T05 | Time from when user system finishes sending the           | 2 minutes            |
|     | Process Result Message until the correspondence           |                      |
|     | Process Result Message is sent back                       |                      |
| T06 | Time to re-send in case if NACCS Center server or         | 5 minutes            |
|     | network gets error and no response returns                |                      |
| T07 | Time to re-send in case if errors occur in NACCS Center   | At least 3 minutes   |
|     | server and the Process Result Output Message returns      |                      |
|     | notifying "Center busy"                                   |                      |
| T08 | Interval to carry out stored message retrieving procedure | It is recommended to |
|     | (REQ) and error message retrieving procedure (SYG)        | take about 30        |
|     | periodically  | minutes interval     |
|     |   | before executing the |
|     |   | next procedure.      |

| Table 4.2.13 | Timer's | Value List |
|--------------|---------|------------|
|--------------|---------|------------|

(Note 1) Value of timer is the specified value in the present system.

(Note 2) T01 through T08 described in ID column of Table 4.2.13 are the IDs of each timer described from Figure 4.2.15 to Figure 4.2.18.

Figure 4.2.15 Setting Timer in Normal Communication
