

## Appendix 2. Access Lines and Access Points

In NACCS User Network, users can establish access via dedicated line or Fiber Optic Broadband.

### (1) Dedicated line connection

A dedicated line allows the user system to stay connected to NACCS Center server.

For dedicated line users, NACCS User Network connection fees are line speed-based across the board throughout Japan (charge for the Backbone Network plus charge for access line). In other words, for charge for dedicated line (charge for the Backbone Network plus charge for access line), flat-rate billing applies regardless of the distance between the access point and the user's device (distance of access line).

### (2) Fiber Optic Broadband

Fiber Optic Broadband allows the user system to stay connected to the NACCS Center host via optic fiber, enabling high speed communications.

For Fiber Optic Broadband users, NACCS User Network connection fees are flat across the board throughout Japan (charge for the backbone network plus charge for access line). In other words, for charge for Fiber Optic Broadband (charge for the backbone network plus charge for access line), flat-rate billing applies regardless of the distance between the access point and the user's device (distance of access line).
